

Legali-Sync: Eliminating the Regulatory Blindspot

How we use Multi-Hop RAG to protect companies from invisible legal shifts that could cost millions

The £1 Trillion Information Avalanche

Corporate legal teams are haemorrhaging time and capital tracking regulatory changes across jurisdictions. The statistics are damning:

- Lawyers spend 40% of their day manually tracking updates across fragmented sources
- One missed gazette notification = £2-15M in non-compliance fines
- Average Fortune 500 company monitors 847 different regulatory bodies
- Traditional legal research tools are 72 hours behind real-time publication

The cost of ignorance is no longer theoretical—it's existential.

The Legali-Sync Solution

Three-stage intelligent pipeline that transforms regulatory chaos into strategic clarity

Continuous Crawling

Crawl4AI monitors 2,400+ official sources every 6 hours—government gazettes, regulatory portals, legislative databases—with zero latency tolerance.

Intelligent Mapping

Django/PostgreSQL ingests, normalises, and categorises every document using custom taxonomies. JSONB schemas adapt to jurisdiction-specific formats automatically.

Strategic Reasoning

Multi-Hop RAG doesn't just retrieve—it synthesises. Cross-references amendments across years, jurisdictions, and document types to surface hidden compliance impacts.

The Django Backbone

Enterprise-grade architecture designed for scale, security, and surgical precision:

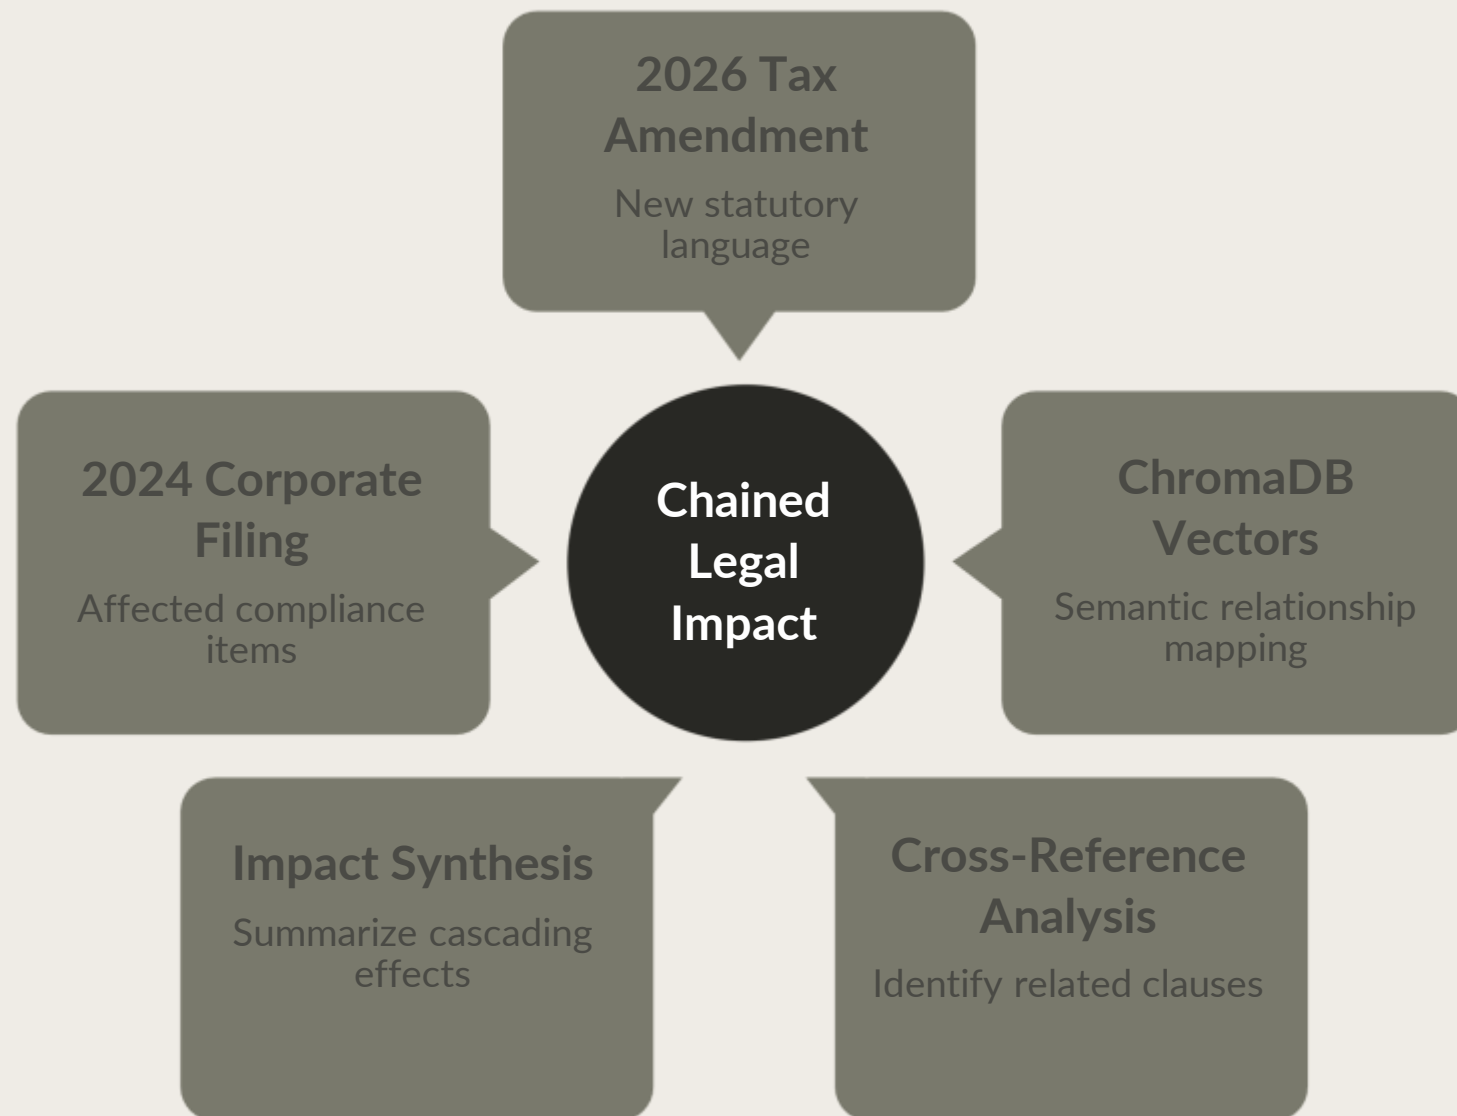

- **Django-Celery** for asynchronous task scheduling across thousands of URLs—handles 15,000+ concurrent crawl jobs without bottlenecks
- **PostgreSQL JSONB** for dynamic regulatory schemas that accommodate diverse document structures without rigid table constraints
- **Multi-tenant architecture** for secure data isolation with client-specific encryption keys and role-based access control
- **Redis caching layer** for sub-50ms query response times on frequently accessed regulatory histories
- **Webhook-driven alerts** triggering real-time notifications to Slack, email, and compliance dashboards

Why This Matters

Regulatory data isn't static. It's versioned, cross-referenced, and jurisdiction-dependent. Traditional SQL fails. Django + JSONB succeeds.

The AI Brain: Multi-Hop RAG & Neural Reasoning

This isn't keyword search. This is cross-document intelligence that maps cascading legal impacts.

Cross-Document Reasoning

When a new tax amendment publishes, Legali-Sync doesn't just flag it. The system:

1. Embeds the amendment into ChromaDB vector space
2. Identifies semantic relationships with historical filings (2-5 years back)
3. Generates impact memos explaining downstream compliance obligations
4. Ranks urgency based on client-specific profiles and past penalties

We don't just find text. We synthesise legal strategy.

The Compliance Officer's Command Centre

Built for humans who need to act fast, not read faster.

Impact Alerts

AI-generated memos sent via webhooks within 90 seconds of source publication. Each alert includes affected regulations, required actions, and deadline calculations.

Jurisdiction Filtering

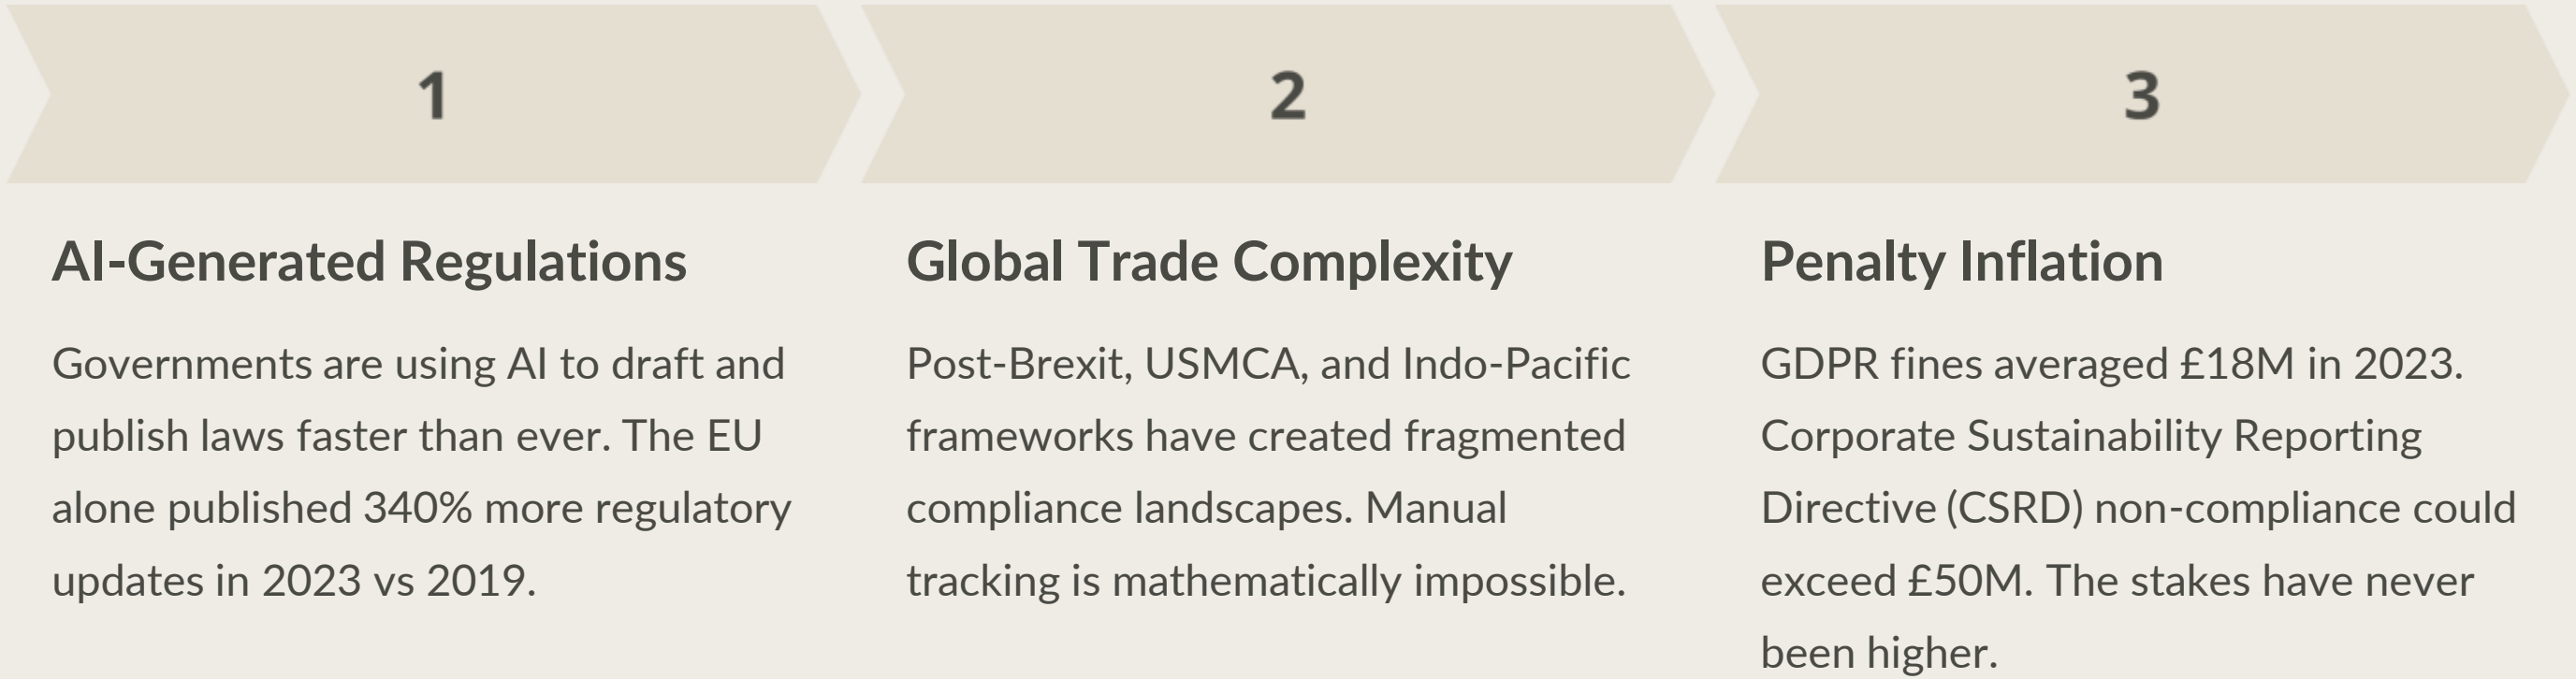

Single-click views across EU, UK, US Federal, and 50+ international bodies. Custom profiles let teams focus on what matters to their operations.

Historical Context

Every alert links to amendment history, related precedents, and vector-similarity matches. Context isn't optional—it's embedded.

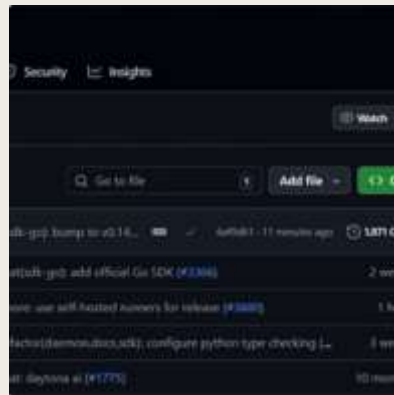

Why Now?

Manual compliance infrastructure is obsolete. Legali-Sync is the reset.

Thank you

Thank You

Legali-Sync is an AI-powered platform that automatically monitors 2,400+ regulatory sources in real-time, uses Multi-Hop RAG to synthesize cross-document legal impacts, and delivers actionable compliance alerts within 90 seconds—eliminating the manual tracking that costs companies millions in missed updates and fines.
